SWE326: Software Testing

Software Testing Project Details

Objective

To develop practical expertise in software testing through hands-on experience with real-world, mission-critical application.

Organization

The project will be carried out in teams of 5 students each. Each student should act as a team leader for one phase.

Brief Description

The project involves system testing a web application for an events and conference management system.

Each team will be assigned one module or subsystem of the system by the instructor. This web application is designed to facilitate the organization of various types of events, including meetings, lectures, and complex conferences.

Link to the system under test:
https://swe326.online

https://getindico.io/

https://indico.global/

The project has the following 5 phases:

Phase 1: Extract all requirements from the user manual and document them in the system test plan.

Phase 2: Design system test cases based on the extracted requirements, execute them, report the results, and document all identified bugs with supporting screenshots.

Phase 3: Utilize software testing and automation tools, such as Testsigma and Selenium, to implement automated testing for the test cases and apply additional testing methodologies (more details will be provided later).

Deliverable

The complete System Test Plan (Template provided).

Evaluation Criteria for Software Testing Project Master Test Plan:

1. **Completeness**: Assess the extent to which the master test plan covers all the necessary aspects and components of the software testing project. Consider if it includes sections such as History, Introduction, objectives, System Requirements, System Test Cases, and Report on the Execution of System Test Cases(Execution Results, Bugs Report, and Bug Screenshots.
2. **Clarity and Organization**: Evaluate the clarity and organization of the master test plan. Assess if the information is presented in a logical and structured manner, making it easy to understand and follow.
3. **Coverage**: Evaluate the coverage of the master test plan in terms of the identified testing activities.
4. **Testing tools**: Utilize testing tools for performance, usability, automation testing, etc. Capture screenshots to showcase the testing process and results.

Remember, these evaluation criteria can be customized and adapted based on the specific requirements and objectives of the software testing project.
